CADIZ WATER TREATMENT PLANT

Drinking Water

Consumer Confidence Report

For 2021

The Village of Cadiz Public Water System has prepared the following report to provide information to you, the consumer, on the quality of our drinking water. Included within this report is general health information, water quality test results, how to participate in decisions concerning your drinking water and water system contacts.

The village of Cadiz public water system uses surface water drawn from Tappan Lake, which was created by impounding Little Stillwater Creek. For the purpose of source water assessments, in Ohio all surface waters are considered to be highly susceptible to contamination. By their nature, surface waters are readily accessible and can be easily contaminated by chemicals and pathogens. Also compared to ground water, they tend to move swiftly, so an upstream spill may rapidly arrive at the public drinking water intake with little warning or time to prepare. Therefore, the drinking water supplied to the Cadiz public water system has a high susceptibility to contamination.

The Village of Cadiz public water system treats the water to meet drinking water quality standards but no single treatment technique can address all the potential contaminants. The potential for water quality impacts can be further decreased by implementing measures to protect Tappan Lake and its watershed. More detailed information is provided in the Village of Cadiz Drinking Water Assessment Report, which can be obtained by calling Roy Moore at 740-942-3884.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immunocompromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers.

EPA/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Hotline (800-426-4791).

"If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The Village of Cadiz Public Water System is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline at 800-426-4791 or at http://www.epa.gov/safewater/lead."

Public participation and comment are encouraged at regular meetings of The Village of Cadiz council which meets the first and third Thursday of each month. For more information on your drinking water contact Roy Moore at 740 -942-3884

| | MCLG or | MCL, | Level | Ra | nge | | | |

| Unit Descriptions | | | | | |
|-------------------|--|--|--|--|--|
| Term | Definition | | | | |
| ppm | ppm: parts per million, or milligrams per liter (mg/L) | | | | |
| ppb | ppb: parts per billion, or micrograms per liter (μg/L) | | | | |
| NTU | NTU: Nephelometric Turbidity Units. Turbidity is a measure of the cloudiness of the water. We monitor it because it is a good indicator of the effectiveness of our filtration system. | | | | |
| NA | NA: not applicable | | | | |
| ND | ND: Not detected | | | | |

| Unit I | Descriptions |
|--------|---|
| NR | NR: Monitoring not required, but recommended. |

| nportant Di | inking Water Definitions | | | | | | |
|-----------------------------|---|--|--|--|--|--|--|
| Term | Definition | | | | | | |
| MCLG | MCLG: Maximum Contaminant Level Goal: The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety. | | | | | | |
| MCL | MCL: Maximum Contaminant Level: The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology. | | | | | | |
| TT | TT: Treatment Technique: A required process intended to reduce the level of a contaminant in drinking water. | | | | | | |
| AL | AL: Action Level: The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow. | | | | | | |
| Variances and Exemptions | Variances and Exemptions: State or EPA permission not to meet an MCL or a treatment technique under certain conditions. | | | | | | |
| MRDLG | MRDLG: Maximum residual disinfection level goal. The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants. | | | | | | |
| MRDL | MRDL: Maximum residual disinfectant level. The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants. | | | | | | |
| MNR | MNR: Monitored Not Regulated | | | | | | |
| MPL | MPL: State Assigned Maximum Permissible Level | | | | | | |
| < | The "<" symbol: A symbol which means less than. A result of <5 means that the lowest level that can be detected was 5 and the contaminant in that sample was not detected. | | | | | | |
